

Job portal(Jobless)

The problem statement was approached by following the steps which are mentioned below:

1. There are 3 different entities when it comes to the hiring platforms, the recruiter, job seeker and the platform admin.
2. All of them will first of all signup to register on the platform and will be having different views and rights for performing different tasks.
3. Depending on the role the 3 entities will be having different form fields displayed on the signup page but all of them will be having one common login.
4. A job portal is a platform where different recruiters of different companies will come in and post various job positions which their company is offering.
5. So when they create a job post the most essential properties of a job post would be the job title, company name, company information, job information.
6. Once they specify these they can post the job on the platform. After posting the companies could come across situations wherein they might have to update the job details or maybe delete the job post because maybe their requirement is fulfilled.
7. So an Edit and Delete button is provided on the platform for the recruiters.
8. They can add a new job post by clicking on the “add job post” button.
9. Now all these things will only be visible to the recruiter of a particular company. No Job seeker should be able to view the edit and delete button of a job post.
10. Job seekers should only be able to view the job posts being offered by all the companies registered on the platform.

11. Once they view it and read the details they can simply click on the apply button and the job post will be added to the “My applications” list.
12. The third entity which is the admin represents the job portal or the platform. Admin will be able to view all the job applications and all the job posts. He will not be able to manipulate anyone’s application or job post.
